SERVICE INSTRUCTIONS

"ILLINOIS" SINGLE-BITTED KEY LOCKS

1. Types of Mechanism. The "G" type mechanism (illustrated in figure 1) with the No. 260 key employs five tumblers and cannot be masterkeyed. It is suitable for limited security requirements and when the amount of use is limited. This mechanism is used in all 3000-series locks, and is particularly suitable for light uses indoors, requiring limited security and quickly available key service.

The "F" type mechanism (illustrated in figure 2) also has five tumblers but is designed to provide accurate key positioning necessary for successful masterkeying of flat-tumbler locks, and for use in situations demanding long-wearing qualities as needed in builders' hardware locks. This is accomplished by the use of spring-tempered brass key guide inserts. The No. 360 key is used, and also provides quickly available key service. All locks of the 7000-series employ this mechanism.

- 2. Principles of Operation. Both the "G" type mechanism (No. 260 key) and the "F" type mechanism (No. 360 key) have tumblers which are forced against the serrature of the key by independent springs. They are arranged so that when the tumbler and key depth numbers are matched in each tumbler position with the key inserted, the tumbler ends are in alignment with the plug periphery. When the key is withdrawn the tumblers are forced by the springs out of alignment and into a splined recess provided in the barrel or stationary member of the locking cylinder, thus preventing the turning of the plug assembly without the use of the proper key.
- 3. Installation and Removal of Plug Assemblies. Standard 3000-and 7000-series cabinet locks, using either the "G" type (No. 260 key) or "F" type (No. 360 key) mechanism, are usually made with a "retainer tumbler" (No. 3060-illustrated), and a hole is provided in the cylinder barrel for the insertion of a wire or suitable tool providing means for forcing the retainer tumbler out of the cylinder barrel recess, and allowing the plug

assembly to be easily removed for service or replacement. Assembly of the plug assembly into the cylinder barrel is easily accomplished by compressing the retainer tumbler and pushing the plug assembly into the cylinder barrel until the retainer tumbler automatically springs into the barrel recess.

Changing Combinations. Type "G". This mechanism (No. 260 key) requires four different kinds of tumblers (as illustrated), one for each of the four depths provided on the key. Example for Setting-Up a Combination: The combination number (depth numbers) of the illustrated No. 260 key is 42312 (number starts from point of the key). The corresponding tumbler numbers for this key are 3059Q (depth No. 4), 3059F (depth No. 2), 3059L (depth No. 3), 3059A (depth No. 1), and 3059F (depth No. 2). See Parts List Kit No. X12.

Assembly of Tumblers for Keying Alike, Changing Combinations, Masterkeying. Type "F". This mechanism (No. 360 key) requires four different kinds of tumblers, one for each of the four depths (Nos. 3059A, 3059F, 3059L, 3059Q,) for non-masterkeyed combinations. For masterkeyed combinations eight tumblers (illustrated) are needed to provide all combinations. Example for Setting-Up a Combination: The combination number (depth numbers) of the illustrated primary key is 42312 (number starts from point of the key). Assume that the master combination number (depth numbers) is 42424. The corresponding tumbler depth numbers to fit the mechanism assembled to fit the example keys are then 4-4, 2-2, 3-4, 1-2, 2-4, or tumbler numbers 3059Q, 3059F, 3059M, 3059B, 3059H. All type "F" mechanisms have number 3052 guides between the tumblers. See Parts List--Kit No. X12.

Some plug assemblies have the tumblers held in place by staking the metal above the spring hole. Disassembly can easily be accomplished by lightly tapping the tumbler to be removed on the end opposite the spring hole openings. This staking is to prevent disassembly of the tumblers when handling plug assembly prior to assembly into lock

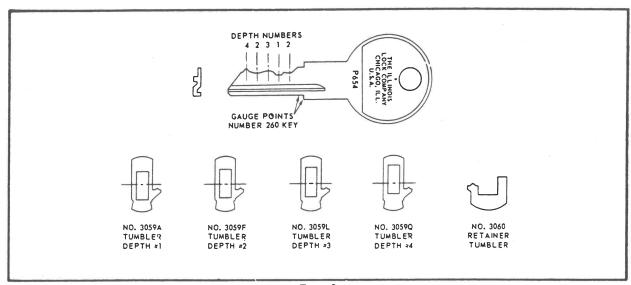

Fig. 1

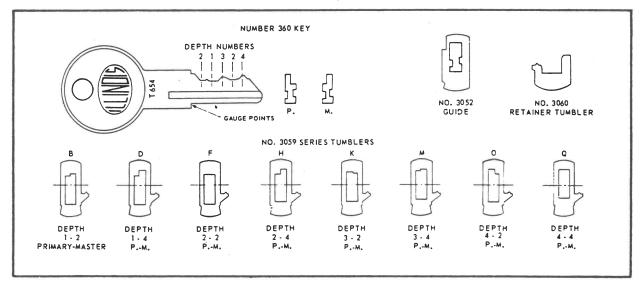

Fig. 2

barrel, and has no other functional purpose.

- 5. Key Duplicating. Duplication of ILLINOIS SINGLE-BITTED keys is accomplished by the same generally accepted procedure as that used for all pin-and disc-tumbler lock keys, and can be easily accomplished with any make of standard duplicating machine, by following instructions furnished with the machine.
- 6. Making Single-Bitted Illinois Keys from Code. Determine the combination "depth numbers" to be made by reference to the KEY CODES in this manual. The combination number (example 42312 illustrated figures 1 and 2) starts from the end of the

key. To make this key, place the No. 260 or 360 key blank in the duplicating machine, gauging from the shoulder and straight back of the key as per the machine instructions. Place "depth key" number 4 (See Parts List--Kit No. X14) in the cut key position in machine, taking care to see that the gauging is accurate. Cut number 4 depth on the blank to the wiath on the depth key-Then replace with number 2 depth key and cut number 2 depth on the blank in the second position from the key point, and cut to the same width as that on the depth key. Continue the same process with depth numbers 3-1-2 depth keys to complete all depth cuts. Join the depth cuts, taking care to maintain the full depth cut surface.

"ILLINOIS" DOUBLE-BITTED KEY LOCKS

1. Types of Mechanism. The "C" type mech- 3. Installation and Removal of Plug Assemanism (illustrated figure 3) uses No. 110, 210, and 210M keys, and is constructed entirely of brass. Eight tumblers arranged in sets of two are used together with three brass key guides to provide accurate key positioning and long wear. This mechanism is used with all 1000-series locks, and is particularly suitable for outdoor hard use, with good security, and key service practically restricted to locksmiths.

The "D" type mechanism (illustrated figure 3) uses No. 110, 210, 220, 210M, and 310 keys, and has a non-ferrous alloy diecast plug body and key guides. Eight tumblers arranged in sets of two are used. This mechanism is used with all 5000-series locks, and is particularly suitable for indoor or outdoor light use with low cost, good security, and key service practically restricted to locksmiths.

The "E" mechanism uses No. 105 and 4. 115 keys, and has a non-ferrous alloy diecast plug body and key guides. Fight tumblers arranged in sets of two are used. This mechanism is used with all 4000-series locks, and is particularly suitable for outdoor light use with limited security, and key service practically restricted to locksmiths. Particularly suitable for screw-style locks for vending machines with good security.

2. Principles of Operation. The "C" "D" and "E" type mechanisms have tumblers arranged in pairs, one pair for each depth position on the key. The keys have coordinated cuts (serratures) on two sides. The key passes through a suitably placed hole in the tumblers with a working clearance only, thus providing positively operated tumblers which are mechanically positioned without the aid of springs. Each pair of tumblers for types "C" and "D" have one spring to throw the tumblers in opposing directions and into opposing splined recesses in the barrel of the lock cylinder when the key is withdrawn. The type "E" tumblers are arranged to spring in one direction only. Insertion of the proper key aligns the tumblers with the periphery of the plug, thus allowing the key and plug assembly to be turned.

- blies. Many of the standard cabinet locks (series 1000, 2000, 5000, 6000) are made with an oval-shaped spring wire ring to hold the plug assembly into the cylinder barrel. Although this construction is not designed for disassembly, the plug assembly can be removed from the cylinder barrel. Provide a block (preferably of wood, to prevent marring) with a hole approximately 11/16" in diameter; place the face of the lock cylinder on the block and over the hole. Strike the back end of the plug assembly with a sharp blow and the plug assembly will be ejected from the barrel. Some marring of the barrel finish will result, however, the burr can be tapped back into place with little damage to the finish. Re-assembly will be obvious, but it is suggested that a new ring be used (assembly rings furnished with Kit No. X13).
- Assembly of Tumblers (Type "C" "D" and "E") for Keying Alike, Changing Combination, Not Masterkeyed. The tumblers for the "C" and "D" types are arranged in pairs, one pair for each depth position on the key. Each pair of tumblers consists of one "regular" tumbler of a given depth number and one "opposite" tumbler of the same depth number. It will be noted from the tumbler illustrations figure 3 that for each "regular" tumbler for a given depth number there is an "opposite" tumbler with same depth number but, being reversed end for end, to provide the spring arrangement illustrated. Example for Setting-Up a Combination: Combination number (depth numbers) 1-2-3-4 illustrated (number starts from point of the key). The corresponding tumbler numbers for the first position would be 3015A and 3015D, paired for depth No. 1, assembled in the plug in the same relative position illustrated. Tumbler numbers 3015B and 3015C are paired for depth No. 2, assembled in the plug in the same relative position illustrated. Tumbler numbers 3015B and 3015C are paired for depth No. 3, assembled in the plug in the opposite (end for end) relative position illustrated. Tumbler numbers 3015A and 3015D are paired for depth No. 4, assembled in the plug in the opposite (end for end) relative position illustrated. In each pair

of tumblers, the "regular" is placed closest to the head (bow) of the key and the "opposite" farthest from it. This is necessary to get the spring arrangement in the proper direction. It should be noted that when facing the front of the plug, all springs are to be on the side opposite to the key embossing.

The guide No. 3012A is used in all 1000series locks, which are all brass.

Type "E" mechanisms have two tumblers alike making a pair for each depth position on the key. Four tumblers, one for each depth position are provided; numbers 3010A (depth No. 1), 3010B (depth No. 2), 3010C (depth No. 3), 3010D (depth No. 4).

In the type "E" mechanisms, the tumbler spring throws each pair of tumblers in one direction, therefore the "opposite" tumbler and the reversing of tumblers end

double bitted key locks is identical to that of locks not masterkeyed, described above, except that two positions are provided in each tumbler, one for the primary key, and one for the master key. An example for setting-up a combination is as follows: Assume the primary key combination number (depth numbers) is 1-2-3-4 (illustrated figure 4), and the master key combination number (depth numbers) is 1-2-1-3 (illustrated in Fig. 4). The depth numbers required for the first position are 1-1, the second 2-2, the third 3-1, and the fourth 4-3. The required pair tumblers for the first position (1-1) is therefore 3017A (regular) and 3017M (opposite); for the second position (2-2), 3017E (regular) and 3017H (opposite); for the third position (3-1), 3017F (regular) and 3017G (opposite); for the fourth position (4-3), 3017A (regular) and 3017M (opposite). So as

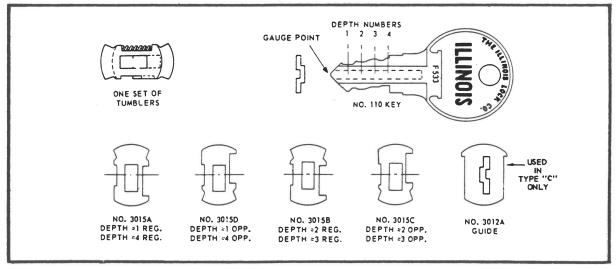

Fig. 3

for end, as mentioned above for the type "C" and "D" mechanisms, is not necessary here.

Example for Setting-Up a Combination: Suppose the combination number (depth numbers) was 1-2-3-4. The corresponding tumbler arrangement then would be two No. 3010A tumblers for depth No. 1, two No. 3010B for depth No. 2, two No. 3010C for depth No. 3, and two No. 3010D for depth No. 4.

Assembly of Tumblers (Type "C" and "D"), Masterkeyed. The principle of tumbler and key design for masterkeyed "Illinois"

not to lose the proper spring direction of the tumblers, the masterkeyed plugs should be filled to the primary key. The method of placement of the "regular" and "opposite" tumblers is the same as was mentioned in the type "C" and "D" non-masterkeyed description.

5. Duplicating 'Illinois' Double-Bitted Keys.

After reading 'Principles of Operation,' it will be clear that the relationship between the cuts on each side of the key is fundamentally important and therefore it will be apparent that the gauging of the key and blank in the duplicating machine must be

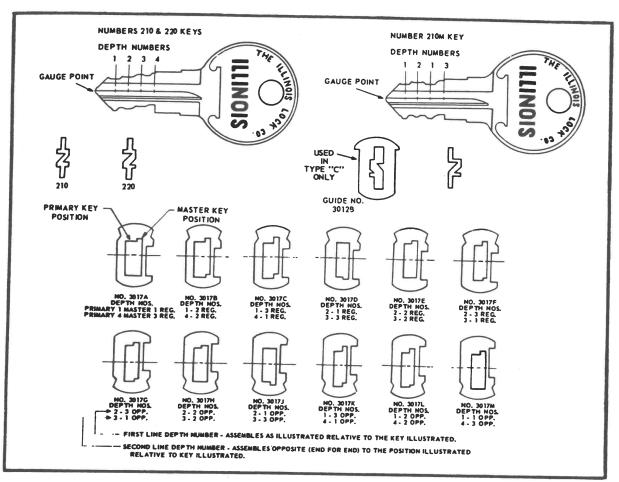

Fig. 4

accurate. If the distance from one cut edge of the key to the other is too great, the key will not enter the tumbler hole; if the distance is too short, the pair of tumblers will not draw into alignment. If the dimension is oversize in spots, the key will enter and withdraw roughly.

Gauge the key to be duplicated and the 6. blank if possible from the point of the key and blank, make the first cuts in the conventional manner and then repeat the process for the cuts on the opposite side of the key. (If you have Independent machines, it is suggested that you purchase Illinois attachment bars Nos. M276A, M276B, and M276C. See Service Parts Price List Number 254 or Catalog Number 354. These bars are designed so Illinois double-bitted keys and blanks are gauged from the point and the center groove.) After cutting the duplicate key, operate a tumbler over the key to check for clearance and accuracy. The tumbler

should ride the key when held slightly tipped both ways from the normal vertical position. If there are any tight spots, adjustment can be made with a small swiss pattern file, taking care not to destroy or reduce the cut lengths. (Guide tumblers are included in Kit No. X14, along with depth keys.)

S. Making Double-Bitted Keys from Code. The combination 1-2-3-4 (depth numbers) (illustrated figure 4) is on the top edge of the key when the key is placed with the name "Illinois" up and to the right with the exception of the number 310 key which is placed with the name down and to the right. These are the combination or depth numbers which appear in the code tables following the key or code numbers. The opposing cuts on the bottom edge of the key correspond to the upper cuts in reverse. A number 1 on the top is number 4 on the bottom, etc. Each set of cuts (one top number) equals 5. Ex-

ample:

Combination number (top cuts) 3243
Corresponding bottom cuts 2312
Total 5555

Depth keys for each Illinois keyway are available (see Service Parts List No. 254). There are four depth keys to each set. Each depth key is cut to one depth number in all positions. Tumblers are also included in the depth key kit for use as a guide in providing the proper clearances between cuts.

All Illinois double-bitted keys are designed to be gauged from the point of the key, and in view of the precision required it is recommended that you provide a means for gauging in this manner. Do not rely on the key shoulders because they are not accurate. (If you have Independent machines, special bars can be provided--see Service Parts List Number 254.)

All Illinois double-bitted keys are further designed to stop on the face of the first tumbler positioned just back of the plug head. Therefore, the overall length of combination milling (depth number milling) must

be accurate. The milling cutter used when making a key should have its leading side flat, thus providing a square stop shoulder at the end of the last depth cut position (see figure 4). This square shoulder allows greater key and/or lock life.

Make the top cut (combination or depth numbers as per code--example 1-2-3-4 illustrated figure 4) first, using the corresponding depth key for each depth number to establish each cut position. Then reverse the blank position and make the cuts for the opposite side of the key (example 4-3-2-1). Make each cut the exact same length and position as that on the depth key. After completing the making of the cut positions, remove the key from the machine and join the cuts with a small swiss pattern file, being very careful not to reduce the cut lengths. Then try passing a tumbler (Depth Key Kit Number X14) over the key, and touch up the high spots between the cuts to allow the tumbler to ride free when held slightly tipped both ways from the normal vertical position.

DUO LOCKS

Purpose. Duo locks are designed specifically for high-security requirements to meet
the demand for plant-security systems, and
institutional installations where controlled
key service is desirable.

This company is forced to accept the fact that it is impossible to have the best in security and at the same time provide an immediate local service on a national scale. A completely free key service would obviously destroy the controlled key system. On the other hand, it is also most desirable to retain the services of dependable locksmiths on a co-operative basis to service Duo locks and keys.

The company will cooperate with any dependable locksmith in suggesting to institutions using Duo locks to make arrangements with him for local service. Service arrangements with local locksmiths are always suggested to companies using Duo plant-security systems when sold by this company. Locksmiths who sell Duo plant-security systems obviously will arrange to provide proper service.

A prompt service is provided by the com-

pany to furnish Duo keys by number and replacement locks to locksmiths (see Service Parts Price List Number 254 for prices). In some instances it is desirable for locksmiths servicing factories and institutions to carry replacement locks for emergency service.

A great many users of Duo locks purchased them expressly because they do not want keys generally available, and require a controlled service through a single source. Therefore the cooperation of locksmiths is requested in the carrying out of a policy designed to meet the needs of this specialized field.

Duo locks can be furnished with registered keys. Under this system, keyed-alike locks can be provided with an exclusive key number for an area of 500 miles surrounding the location. Control of replacement keys and locks is provided by owner signature. Locksmiths can sell and service this system by requesting signature cards, and the routing of sale and service through themselves.

Above Key numbers always appear with letter pretix.

When X prefix is used lock is <u>not</u> master keyed.

When prefix "AP" through "GW" appears, locks are master keyed.
